

PG BOARD TAF™

Cleaning and Maintenance

- The PG BOARD TAF white polypropylene facing can be cleaned with most over-the-counter cleaners (pH neutral cleaners preferred). Caustic, high pH cleaners should be avoided. DO NOT USE orange-based cleaners and products containing chlorine bleach and/or strong oxidizing agents.
- When cleaning, it is suggested that diluted solutions be used and that the surface be wiped clean of any residual cleaner when finished. Dried cleaner residue on the facing will attract dirt and dust after cleaning.
- For PG BOARD TAF with optional perforated facing, it is recommended that the cleaner be applied to a cloth or brush, rather than directly to the facer, so the cleaner does not wick through facing holes.
- It is suggested that cleaners be tested in a small, obscure area before general cleaning is performed.

Note: The use of power washing equipment is not recommended as operating water pressure can damage the material facing and drive moisture into the insulation.
